

Poly-Tron Accelerator

Data Sheet

Product Description

Poly-Tron Accelerator is an activated polyol (Part A) designed to speed up the curing process of Poly-Tron elastomeric concrete. This is a convenient option for many contractors who face limited traffic downtime.

Application

Add Poly-Tron Accelerator to only Part A just prior to mixing in the field. The accelerated material in 50°F temperatures will reach the physicals listed in the data sheet at 75°F. This is approximate due to the many variables that may occur in the field including product mass, wind, temperature, and armor in the joint. Accelerator syringe is easily dispensed by using a pen or pencil into part "A" any time prior to mixing part "A" and part "B" components together.

Packaging

Poly-Tron Accelerator is packaged in convenient syringes and sold in lots of 100, 250, or 1000 for best pricing.

Precautions

Refer to Material Safety Data Sheet for detailed health and safety information prior to use. Do not add more than one accelerator per unit or the material may flash-cure without notice.

Shelf Life

One year from manufactured date in the original, unopened containers.

Safety

Refer to Material Safety Data Sheet for detailed health and safety information prior to use.
